

SYSTEM AND METHOD FOR COMMUNICATING USING MULTIPLE MEMORY BANKS

A method for communicating data is provided that

ABSTRACT OF THE DISCLOSURE

includes communicating a first set of data from a first first serial-to-parallel converter channel to a communicating a second set of data from a second channel to a second serial-to-parallel converter, the data sets are then converted to a parallel format. The converters are monitored to determine when one or more words of the respective data sets have accumulated in each of the more of the words that have One or converters. accumulated in each of the converters are then written to a selected one of first and second memory banks. single scheduler monitors the memory banks to determine when the words that were written to each of the memory banks have formed one or more cells such that they may be read out of a selected one of the memory banks to be

communicated to an output communications link.
